### Parkland Fluid Resuscitation Formula

- Fluid for the first 24 hours =  $[4 \times \text{Weight (Kg)}] \times \% \text{ TBSA}$
- Give half of the total amount in the first 8 hours
- Pre-hospital Fluid Formula =  $[\text{Weight (Kg)} \times \text{TBSA (\%)}] \text{ divided by } 4 = \text{rate (ml/hr)}$

### Special Considerations

#### Advanced Airway

- All burns with airway compromise, wheezing, stridor, carbonaceous sputum, nasal singling, or significant facial edema must have an evaluation for intubation either by Air Ambulance personnel or by the Emergency Physician at the closest appropriate receiving facility prior to transport to the Burn Center, if the ground ambulance is unable to intubate the patient after 1 attempt
- **Use extreme caution** when utilizing a supraglottic airway for airway compromise as it may be ineffective

#### Merced County EMSA Burn Triage Criteria

- The following patients should be transported directly to the Regional Burn Center (Community Regional Medical Center) bypassing other hospitals if ETA to Community Regional Medical Center is within two (2) hours
  - Patients with 2° (partial thickness) or 3° (full thickness) burns more than 10% total body surface area
  - Patients with 2° (partial thickness) or 3° (full thickness) circumferential burns of any body part
  - Patients with 2° (partial thickness) or 3° (full thickness) burns to face, hands, feet, major joints, perineum, or genitals
  - Electrical burns with voltage greater than 120 volts
  - Patients with chemical burns greater than 10% total body surface area
